AutoCAD 2.0 AutoCAD is generally compatible with other CAD software that uses a similar input device (such as a mouse, trackball, or pen). The engineering graphics software packages that rely on the AutoCAD engine include AutoCAD LT, DesignSpark, and PowerSpark. Other packages include ArchiCAD,

AutoCAD.eDrawings, ArchitectureCalc, AutoCAD Architect, Canvas, CadVue, Covia, eSpace, EngineersCAD, Geomagic, IdealCAD, MRMapper, Microstation, PTC Creo, uCAD, and Vectorworks. AutoCAD's level of compatibility with these applications varies. The most common scenario involves operators using a mouse to drag an object into a drawing. For example, the operator can use the mouse to create a circle and then move it to another part of the drawing. With the mouse, the operators drag and drop an object, such as a picture or a line. The software application recognizes

that object as the same object and it is automatically scaled, translated, and aligned. The operator does not have to specify the object's scale or translation.

In recent releases, some engineering graphics applications have been optimized for the AutoCAD and other software packages. For example, ArchitectsCAD, a 2D drafting software package, includes a plug-in with features that enable users to quickly import and export drawings created in AutoCAD and other software packages. The same software can import 2D drawings created in other software packages. Similarly,

ConceptDraw, a universal software package, now has been customized with the AutoCAD engine. Other engineering design programs are expected to be integrated in the future, including products from Autodesk's Research team that were developed before its purchase by Autodesk. 3D drawing software packages can import 2D drawings created in AutoCAD, but 2D drawings created in other software packages cannot be imported into 3D programs. Both AutoCAD and other engineering applications include the ability to generate 2D drawings from 3D objects and surfaces, using the

same drag and drop functionality. AutoCAD is used for 2D drawings; for instance, mechanical, architectural, and civil engineers use the software to create architectural drawings. The software supports drafting of 2D construction blueprints, sheets, and piping diagrams. AutoCAD and other engineering drawing software have similar drawing features, including layers
