the prognostic relevance of impaired glucose metabolism (IGM) in a cohort of patients with Stage I breast cancer, with no need for systemic adjuvant treatment. The cohort included 955 patients surgically treated for Stage I breast cancer in a single institution between 1988 and 2007. Each patient had glucose metabolism evaluated by oral glucose tolerance test (OGTT) after a mean of 4.4 +/- 2.8 years. Patients with known diabetes were excluded. During a median follow-up period of 22.1 years, 295 women developed recurrent disease and 186 died. When age and pathological tumor size were adjusted, the hazard ratios (HRs) for recurrence and death were 1.16 (95% confidence interval, 0.97-1.38; P = .109) and 1.17 (95% confidence interval, 0.97-1.41; P = .097), respectively, for women with vs women without IGM. However, in patients without receiving chemotherapy, the risks of recurrence and death were significantly higher (HRs = 1.35 and 1.61, respectively; P = .012 and P

Login to Facebook.PASADENA, Calif. -- A NASA analysis has found that the size of the sun's corona, or atmosphere, is getting abnormally large in comparison to that of the sun's diameter. In a paper published today in the Astrophysical Journal, a team of scientists examined data collected by the Helioseismic and Magnetic Imager (HMI) instrument on NASA's Solar Dynamics Observatory. "The best data we've

seen to date show a dipole magnetic field with an uneven distribution, which is different from what we'd expect to see in a regular, solar cycle," said researcher Elinor Roy of the University of Hawaii, lead author of the paper. "The uniformity of the magnetic field suggests that there are more 'attractor' regions in the solar corona." The solar corona is a part of the sun's atmosphere, extending to 10 million miles (15 million kilometers) in Earth's direction above the sun's surface. The solar corona and the sun's magnetic field protect the sun's atmosphere from particles streaming out from the sun's surface. HMI's observations show that the magnetic field is not uniform at the surface, but rather a mixture of areas of strong and weak magnetic fields. "We see where the field is weaker, where the magnetism is weaker, and where it is stronger in the corona," Roy said. "This appears to be an artefact of the turbulence in the solar corona that we have not been able to reduce and model. We will continue to refine our analysis of HMI and 6d1f23a050
